

Simplification to Ritonavir-Boosted Atazanavir Monotherapy

MODAt Trial

Simplification to Ritonavir-Boosted Atazanavir Monotherapy

MODAt: Study Design

Study Design: MODAt

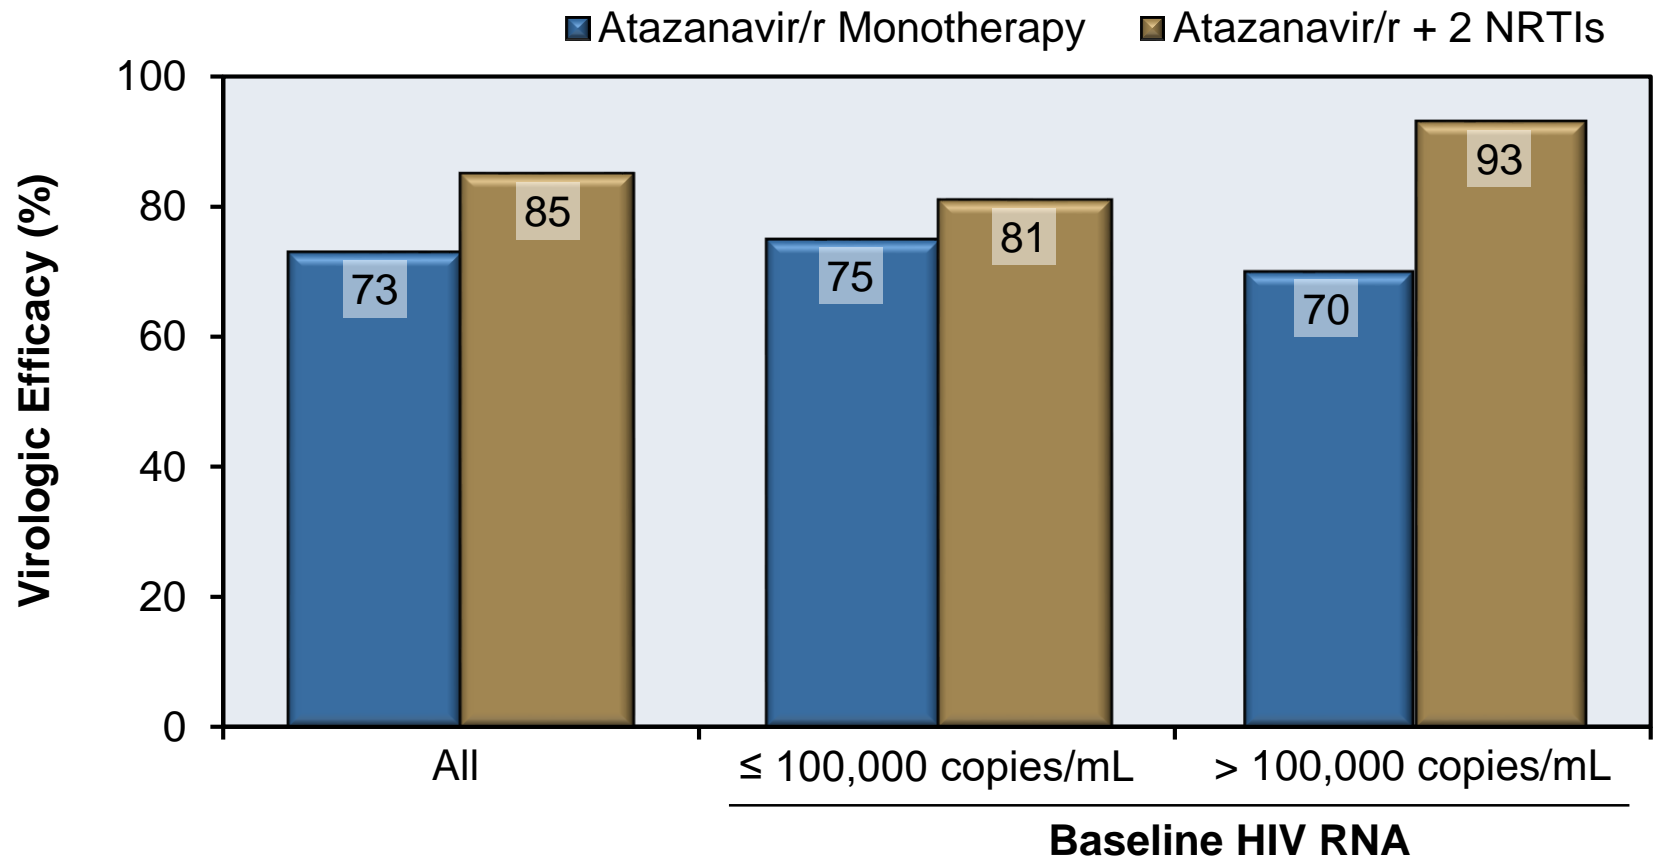

- **Background:** Randomized, open-label noninferiority trial in adults with virologically suppressed HIV infection to evaluate the efficacy of simplification to once-daily ritonavir-boosted atazanavir monotherapy versus continuing once-daily ritonavir-boosted atazanavir with two NRTIs
- **Inclusion Criteria (n = 103)**
 - Age ≥ 18
 - On atazanavir + ritonavir + 2 NRTIs for ≥ 48 weeks
 - HIV RNA < 50 copies/ml for ≥ 24 weeks
 - CD4 nadir ≥ 100 cells/mm³
 - No previous virologic failure
- **Treatment Arms**
 - Atazanavir 300 mg + Ritonavir 100 mg once daily
 - Atazanavir 300 mg + Ritonavir 100 mg once daily + 2 NRTIs

Monotherapy Group
Ritonavir-boosted Atazanavir
(n = 51)

Triple Therapy Group
Ritonavir-boosted Atazanavir + 2 NRTIs
(n = 52)

Simplification to Ritonavir-Boosted Atazanavir Monotherapy MODAt: Results

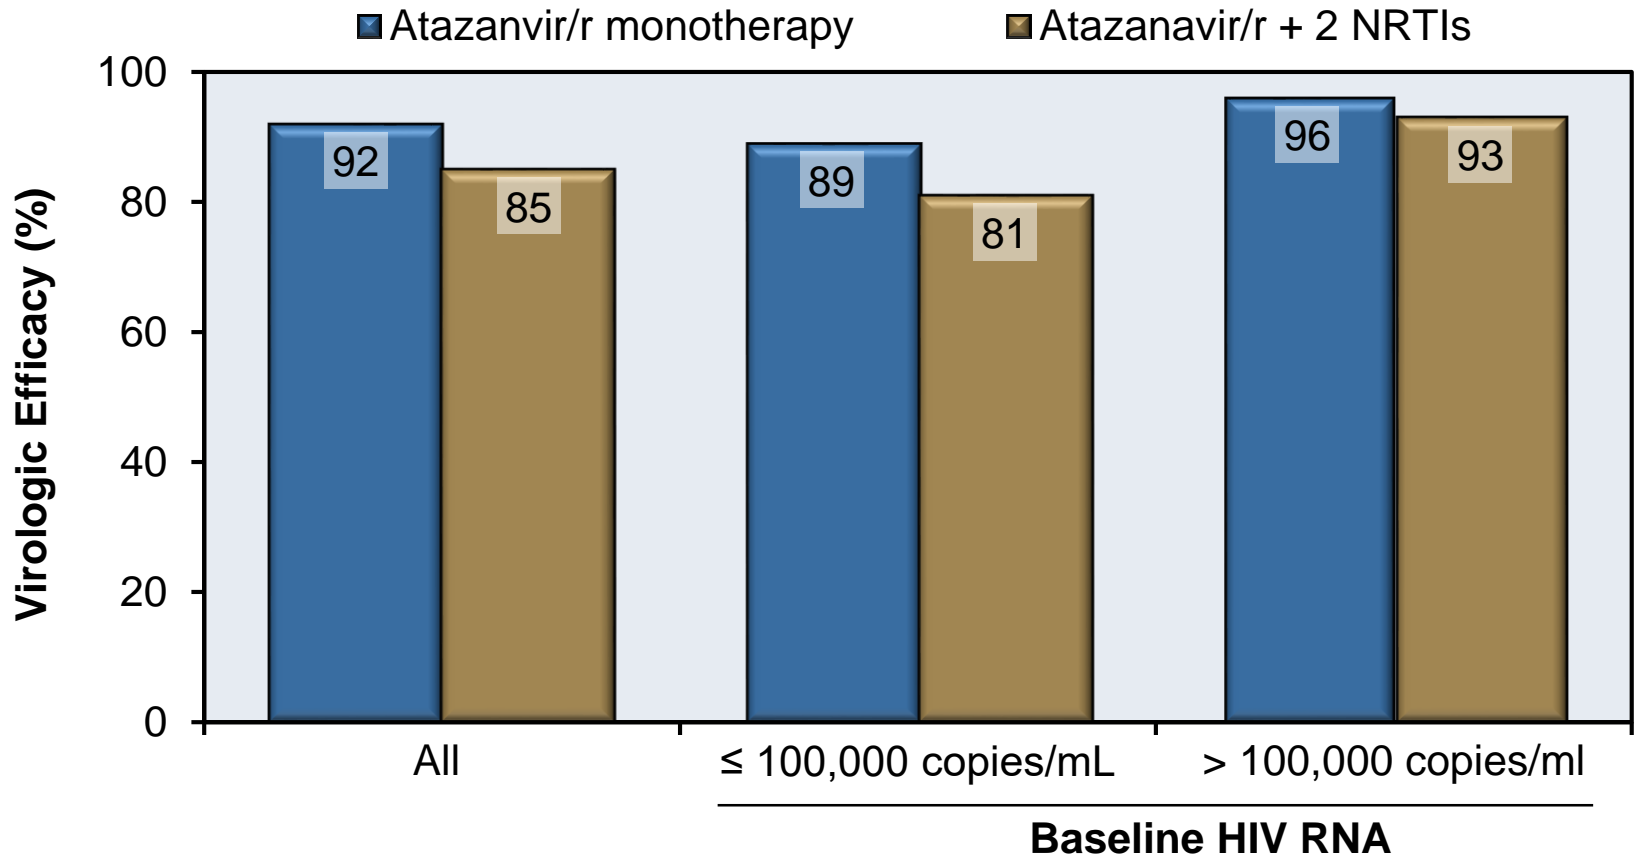

Week 48: Virologic Response by HIV RNA (ITT, re-intensification=failure)

Simplification to Atazanavir/r Monotherapy

MODAt: Results

Week 48: Virologic Response by HIV RNA (ITT, re-intensification=success)

Simplification to Ritonavir-Boosted Atazanavir Monotherapy MODAt: Conclusions

Conclusion: “ATV/r monotherapy treatment simplification showed lower virological efficacy in comparison with maintaining triple therapy; NRTIs reintroduction was effective in all the individuals.”
